Test Report No. H339

Rigid Plastic Sheets

Model: ARCOPLUS SY 626 TRS Bicolore

Test ordered by:

dott. Gallina S.r.l.

Corso Galileo Ferraris, 70 10129 Torino Italy Manufacturer:

dott. Gallina S.r.l.

Strada Carignano, 104 10040 La Loggia (To) Italy

Remarks:

The content of this test report shall not be modified. The results given in this report relate to the tested sample(s) only. This test report is made according to the requirements of the test procedures in the chapter 2.1. This test report fulfils the requirements of ISO 17025.

Rapperswil, 17. August 2021

Dr. Andreas Bohren Head of SPF Testing

Ozan Türk Test engineer

1 Summary and main results

Test procedures	Version	Date
ACFI Test Specifications No. 11 Rigid Plastic Sheets	1.04	01.07.2015
ACFI Test Specifications No. 00a General Part A	1.03	01.03.2018
ACFI Test Specifications No. 00b General Part B	1.02	01.12.2018
ACFI Collection of resolutions	24	09.09.2020

Test sequence	Date
Sampling date	N/A
Delivery date	04.05.2021
Test date	14.07.2021
Production ice balls	KW26/ 2021
Final assessment and evaluation	14.07.2021

Special remarks on the test procedure:

The test was performed on test specimen H339/1 for roof applications and for facade applications.

Results		
Impact direction	90° - Roof	45° - Façade
Watertightness	HW5	HW5
Light transmission	HW3	HW4
Light shielding

2 Introduction

2.1 Remarks on the test sequence

2.2 Manufacturer's specification

All manufacturer's specifications in this report have been checked for plausibility by the test laboratory and are therefore not marked further.

2.3 Specific abbreviations and formats used in the report

- NR Not required, not relevant
- NA Not applicable
- NS Not specified
- NT Not tested
- - No result as test was not performed

Date and time is always indicated in the format (if applicable) DD.MM.YYYY HH:MM

Indications about tilt angle and sample inclination are always measured from horizontal.

Length always denotes the distance in vertical (south-north) direction as tested

2.4 Instruments and test devices

The instrument types, specifications, serial numbers and calibration status of the instruments and test devices which were used to make the measurements and tests for this test report are filed in an internal database at the test laboratory. Upon request all this information can be made available as required by the ISO 17025.

Ice balls of well-defined diameter and velocity are being shot on the test sample with a compressedair driven launcher. The ice balls are made of transparent laboratory ice without any visible cracks or inclusions of air bubbles. The ice balls are made from ice blocks using a melting procedure. The ice balls are stored for at least 48h at a temperature of $-20^{\circ}C \pm 2^{\circ}C$ before using them for testing. The time between the removal of the storage container and the launching is less than 60 seconds.

Unless otherwise stated, the ice balls are fired horizontally and the test sample is installed vertically. The velocity of the projectile is controlled by the pre-set system pressure. The distance between the point of impact and the measurement of the projectile velocity is less than 1 m. The velocity of the projectiles is measured using photoelectric barriers (Siemens SFH 409-2 & SFH 309). The point of impact is defined by two intersecting laser beams.

The mass of the projectiles is measured directly before launching using an electronic scale (Kern 440-33N).

The tools used for assessment and rating of damages are (as applicable and required by the applicable test specification):

- Visual inspection by two test engineers.
- Vacuum test device according to chapter 8 of the SN EN 13583
- Magnifying glasses (6x magnification)

3 Specimen descriptions

3.1 Specimen identification

Model Description Gross length Gross width Gross height Material composition Surface treatment / Color ARCOPLUS SY 626 TRS Bicolore Multi wall sheet 40 mm thickness, 7 walls 1000 mm 600 mm 40 mm Polycarbonate 2-sided UV-protection / bicolore (satin clear outside/ satin opal inside)

Serial No of test sample(s) Composition / Cross section

See Annex

Remarks: 1200 x 1000 mm (W x L): 2 panels 600 mm wide and 1000 mm long connected together (tongue and groove).

3.2 Description of the support structure

The specimen was installed in a frame on all sides and mounted on a solid underground. The test specimen (1) is installed vertically in a frame made of aluminum profiles (2). The frame is fixed to a rigid background.

3.3 Test Setup

Figure 1 The test specimen (1) in a frame made of aluminium profiles (2).

3.4 Definition of targets

The multi wall sheet is impacted at the following locations (Figure 2):

- (1) Middle: Circle with a radius of 150 mm at the specimen center
- (2) Corner: Circle with a radius of 25 mm at the coordinate (1/10 b / 1/10 l)
- (3) Mid-point between the ribs
- (4) Close to a rib; the distance from the rib is 1/5 of the projectile diameter

Other critical points determined by the test laboratory:

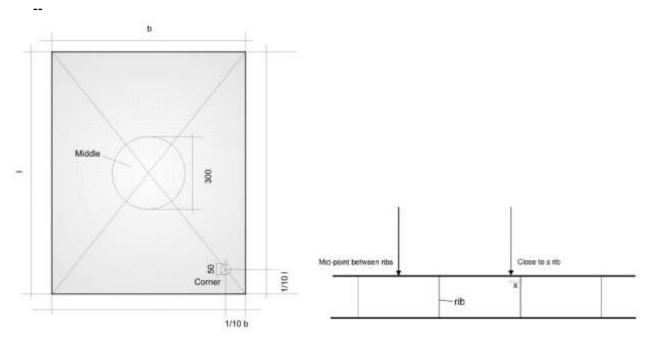

Figure 2: 3.4 Definition of target area

3.5 Photographs of targets

Figure 3: Target area middle (1) Connection area

Figure 4: Target area edge (2)

Figure 5: Target area close to a rib (3)

Figure 6: Target area mid-point between the ribs (4)

4 Test protocol

4.1 Specimen storage prior to testing (conditioning)

The samples were stored at the test climate for more than 3 days before testing.

4.2 Specimen treatment before testing

The samples were cooled with ice flakes for three minutes before testing.

4.3 Ambient conditions

Temperature Temperature of test sample Humidity $T_{Amb} = 23^{\circ}C \pm 2^{\circ}C$ $T_{Sample} = 23^{\circ}C \pm 2^{\circ}C$ $RH = 50\% \pm 10^{\circ}\%$

4.4 Angle of impact

The angle of impact is 90° for sheets used on the roof and 45° for those used on the façade.

4.5 Test protocol

4.5.1 H339-1 (roof applications)

Legend:

- No. Consecutive numbering of the impacts
- Target Impact points according to chapter 4.1
- A Angle of impact (90=perpendicular impact, 45=Façade)
- Time Date and time (CET)
- Ø Projectile diameter
- M Measured mass of the ice ball
- V Measured impact velocity
- E Calculated impact energy
- R [OK] = Valid shot without damage. [X] = Non-valid shot. [B] = Specimen is damaged.

Damages:

- * Visible dent (Figure 8)
- ** Visible dent and a surface deformation or an internal material defect visible (Figure 7)

Figure 7: Visible dent and a surface deformation and an internal material defect visible (shot with a diameter of 50 mm)

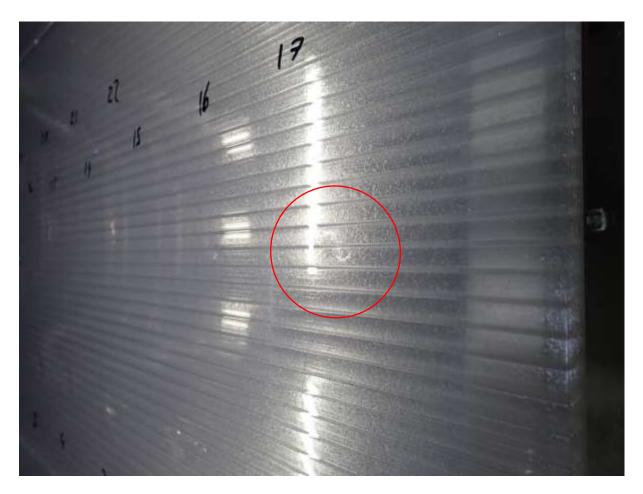

Figure 8: Visible dents (shots with a diameter of 30 mm)

5 Evaluation

5.1 Component function

The component is tested for watertightness, light transmission (where applicable) and appearance.

5.2 Damage criterion

Watertightness: If the test specimen has no cracks or punctures, it is considered to be un-damaged regarding watertightness. If the test Specimen is torn or punctured, it is considered to be damaged regarding watertightness.

Light transmission, appearance: The plastic sheet is not damaged in terms of appearance and light transmission provided the impact has not caused any surface changes or internal material defects. If any surface changes or internal material defects are visible, the plastic sheet is considered to be damaged. Impact-resistant PMMA is considered to be undamaged regarding appearance and light transmission provided no micro-stretching occurs (bluish-white spots).

5.3 Measuring method

Watertightness: Watertightness is tested based on whether puncturing occurs. If a puncture is not visible to the naked eye (specimen - tester distance of no more than 0.5 m), the vacuum test is carried out according to EN 13583.

Light transmission: Light transmission is tested based on whether micro-stretching or any other internal material defect limiting light transmission occurs. Visual tests for micro-stretching or internal material defects are made against a light at a distance of 5 m.

Appearance: The appearance must be tested in daylight or artificial light at a distance of 5 meters between the test specimen and tester. Depending on the product and intended use, it may be necessary to test the appearance of both sides.

5.4 Evaluation

After the testing with a certain ice ball diameter, the different functions of the test samples as defined in ACFI test procedures have been rated according to the regulations in ACFI test procedures as follows:

Angle of impact		9	0° - Ro	of			45	° - Faça	ade	
Component's function	HW1	HW2	HW3	HW4	HW5	HW1	HW2	HW3	HW4	HW5
Watertightness		OK	OK	OK	OK		OK	OK	OK	OK
Light transmission		OK	OK	Х	Х		OK	OK	OK	Х
Light shielding										
Mechanical perfor- mance										
Appearance		OK	Х	Х	Х		OK	Х	Х	Х

Legend:

- OK No reduction of the component's function.
- X Impairment of the component's function.
- -- Not tested/ not assessed.
- N No rating of the component's function required.
- ? Rating is not possible.

6 Additional brand names

The product is also offered under the following brands and brand names:

- None
